Claim 2; Page 3; 25pp; German.

XX
This invention describes milk-derived bifidogenic peptides and their active derivatives or fragments, and combinations of them produced by the central coupling. Such are produced from bovine or human milk by chemical coupling. Such are produced from bovine or human milk by catalying to pH 2 to precipitate proteins. The solution phase is then and cation-exchange HPLC, the fractions adjusted to salt content below conditions. Those fractions adjusted to salt content below conditions. Those fractions for which (BW-BD). (BW-BD) is at least 0.15

XA SHIKER broth containing peptide at 0.2 mg/ml, BD = germ count under similar conditions in a peptide-free control, EW = germ count under similar conditions in a peptide-free control, EW = germ count under similar conditions in a peptide-free control, EW = germ count under similar conditions in a peptide-free control, EW = germ count under similar conditions in a peptide-free control, EW = germ count under similar conditions in a peptide-free control, EW = germ count under similar conditions in a peptide-free control, EW = germ count under similar conditions in a peptide-free control, EW = germ count under similar conditions in a peptide-free control, EW = germ count under similar conditions in a peptide-free control, EW = germ count under similar conditions in a peptide-free control, EW = germ count under similar conditions in a peptide-free control, EW = germ count under similar conditions in a peptide-free control, EW = germ count under similar conditions in a peptide-free control, EW = germ count under similar conditions in a peptide-free control, EW = germ count under similar conditions in a peptide-free control, EW = germ count under similar conditions in a peptide-free control, EW = germ count under similar conditions in a peptide-free control, EW = germ count under similar conditions in a peptide-free control, EW = germ count under similar similar conditions in

DNA encoding human kappa-casein - used for obtaining recombinant polypeptide(s) for use as nutrient supplements, partic, in infant formulae

Claim 44; Page 88-89; 110pp; English.

```
DNA encoding human kappa-casein - used for the prodn. of large amts. of highly purified kappa-casein milk protein for infant use.
                                                                                                                                                                                                                                                                                                                                  means of either a eukaryotic or protective expression system. It is used as a nutrient supplement in milk based products to provide a substantial improvement of the nutritional and biological value of the formulae, making it closer in similarity to human milk. It can also be used as a pharmaceutical.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    A commercial CDNA library prepd. in lambda gtll from mRNA obtd. from human breast tissue removed during the third trimester of pregnancy was screened with rabbit anti-bovine kappa-fasein CDNA. The CDNA insert of a recombinant phage was amplified by PCR to obtain a full-length clone (AAQ89598) encoding human kappa-casein (AAR72696).
                                                                                                                                                                                                                                                                                                            1 YQRRPAIAINNPYVPRTYYANPAVVRPHAQIPQRQYLPNSHPPTVVRRPNLHPSF 55

```
AAR92150 is human milk kappa-casein which is useful as a component of an enteral nutritional product. Kappa-casein has anti-rotaviral activity, it inhibits the attendment of human rotavirus to mammalian cells. The kappa-casein is useful in the treatment and prevention of onset of gastroenteritis and other diarrhoeal diseases caused by rotaviridae esp. in infants, children or immunodeficient patients. Kappa-casein appeared to have no side effects on the subjects treated and is unlikely to be toxic or cause an allergic reaction.
                                                                                                                                                                                                                                                                                                                                                                                                                 Kappa-casein used as anti-rotaviral infection agent in nutritional product - to prevent, retard or treat rotavirus infection, especially in infants, children and immuno-deficient patients
                                                                                                                 Milk protein; kappa-casein; rotavirus inhibition; gastroenteritis; infant formulation; immunodeficiency; diarrhoea.
                                                                                                                                                                                                                                                                                                                                                               Seo AE;
                                                                                       Human milk kappa-casein, inhibits rotaviral infection.
                                                                                                                                                                                                                                                                                                                                                             Mukerji P, Prieto PA,

Nucleic acids encoding secreted polypeptides, designated MOLX polypeptides, useful for treating a MOLX-associated disorder, e.g. cardiomyopathy, atherosclerosis, diabetes and metabolic disorders

Claim 1; Page 78; 223pp; English.

The particular distributes unitarity and the particular and the particular distributes unitarity and integer from 1 to 8). Sequences of the invention of protein where X is an integer from 1 to 8). Sequences of the invention of are useful for treating or preventing cardiomyopathy, atherosclerosis and disorders related to cell signal processing and theoretical for treating or preventing cardiomyopathy, atherosclerosis and disorders related to cell signal processing and metabolic pathway modulation. The MOLX antibodies are useful for treating or preventing diabetes and disorders related to cell signal processing and metabolic pathway modulation. MOLX sequences are useful for treating or preventing diabetes and disorders, e.g. chromosomal disorders, albinism, anaemia, liver cirrhosis, psoriasis, continuous cardiomy and processing and metabolism, anaemia, liver cirrhosis, psoriasis, carring, neurodegeneration, osteoarthritis, organ rejection, cerebral thromosis, ischaemia, hypertension, systemic lupus erythematosus, immune conferences immunodeficiency, HIV (human immuno deficiency virus), viral, bacterial and fungal infections, hepatitis, rheumatoid arthritis, asthma, chaematopoletic, thrombolytic, haemostatic diseases, thrombocytopaenta, ulcers, Alzhelmer's disease, parkinson's disease, huntington's disease, coular disease, muscular diseases, growth disorders, loss of libido, errore danaection nain and engles are useful for proventing stress, depression, pain and epilepsy. They are useful for preventing chemotherapy side effects and as contraceptives. Sequences of the invention are also useful for gene therapy. The present sequence is human kappa caesin precursor-like protein, MOL6. The patent discloses nucleic acid sequences encoding novel secreted

This invention describes milk-derived bifidogenic peptides and their active derivatives or fragments, and combinations of them produced by chemical coupling. Such are produced from bovine or human milk by treatment for 2 hr with proteases, then centrifuging to remove fat and acidifying to pH 2 to precipitate proteins. The solution phase is then cation-exchange HPLC, the fractions adjusted to salt content below and cation-exchange HPLC, the fractions adjusted to salt content below growing Bifidobacterium bifidus and Escherichia coll in presence of the fractions. Those fractions for which (Bw-BO) (Ew-EO) is at least 0.15 or selected where Bw = germ count after 16 hr culture of B. bifidus in similar conditions in a peptide-free control, Ew = germ count under hr culture of E. coli in 3 g/l tryptic broth containing peptide at 0.2 mg/ml, EO = germ count under similar conditions in a peptide-free control. The peptides ANW93865-W93888 are used to treat microbe-related control. The peptides ANW93865-W93888 are used to treat microbe-related control. The peptides ANW93865-W93888 are used to treat microbe-related mycoplasma, filaria and plasmodia, e.g. infections, uruses.

CC mycoplasma, filaria and plasmodia, e.g. infections, diarrhoea, colic, and control in carles.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1 YORRPAIAINNPYVPRTYYANPAVVRPHAQIPQRQYLPNSHPPTVVRRPNLHPSF 55

AAR92150 is human milk kappa-casein which is useful as a component of an enteral nutritional product. Kappa-casein has anti-rotaviral activity, it inhibits the attachment of human rotavirus to mammalian cells. The kappa-casein is useful in the treatment and prevention of noset of gastroenteritis and other diarrhoeal diseases caused by rotaviridae esp. in infants, children or immunodeficient patients. Kappa-casein appeared to have no side effects on the subjects treated and is unlikely to be toxic or cause an allergic reaction.

Nucleic acids encoding secreted polypeptides, designated MOLX polypeptides, useful for treating a MOLX-associated disorder, e.g. cardiomyopathy, atherosclerosis, diabetes and metabolic disorders

Claim 1; Page 78; 223pp; English

molecule (MOL) polypeptides, designated MOLX polypeptides (i.e. a MOL protein where X is an integer from 1 to 8). Sequences of the invention of protein where X is an integer from 1 to 8). Sequences of the invention of are useful for treating or preventing a MOLX-associated disorder in humans. They are useful for treating or preventing action or preventing and molation. The MOLX antibodies are useful for treating or preventing disorders related to cell signal processing and metabolic pathway modulation. MOLX sequences are useful for treating or preventing disorders and disorders related to cell signal processing and metabolic pathway modulation. MOLX sequences are useful for the treatment or diagnosis of other MOLX-associated disorders, e.g. for the treatment or diagnosis of other MOLX-associated disorders, e.g. scarring, neurodegeneration, osteoarthritis, organ rejection, cerebral thrombosis, ischaemia, hypertension, systemic lupus erythematosus, immune diseases, immunodeficiency, HIV (human immuno deficiency virus), viral, hometonic dingal infections, hepatitis, rheumatoid arthritis, asthma, hometonic diseases. haematopoletic, thrombolytic, haemostatic diseases, thrombocytopaenia, ulcers, Alzheimer's disease, Parkinson's disease, Huntington's disease, ocular disease, growth disorders, loss of libido, stress, depression, pain and epilepsy. They are useful for preventing chemotherapy side effects and as contraceptives. Sequences of the invention are also useful for gene therapy. The present sequence The patent discloses nucleic acid sequences encoding novel secreted human kappa caesin precursor-like protein, MoL6

                                                                                                                                                                                                                                                                                                                                                                                                                                                             à
                                                                                                                                        This invention describes milk-derived bifidogenic peptides and their active derivatives or fragments, and combinations of them produced by active derivatives or fragments, and combinations of them produced by chemical coupling. Such are produced from bovine or human milk by treatment for 2 hr with proteases, then centrifuging to remove fat and caidifying to pH 2 to precipitate proteins. The solution phase is then subjected to reverse-phase high-performance liquid chromatography (HPLC) and cation-exchange HPLC, the fractions adjusted to salt content below cardion-exchange HPLC, the fractions adjusted to salt content below growing Bifidobacterium bifidus and Escherichia coll in presence of the fractions. Those fractions for which (Bw-BO). (Ew-BO) is at least 0.15 are selected where Bw = germ count after 16 hr culture of B. bifidus in a selected where Bw = germ count after 16 hr culture of B. bifidus in 3/1 tryptic broth containing peptide at 0.2 mg/ml. EO = germ count under similar conditions in a peptide-free control. The peptides Anw93865-W93888 are used to treat microbe-related diseases caused by bacteria, fundi, yeast, protozoa, viruses.

Control. The peptides Anw93865-W93888 are used to treat microbe-related diseases caused by bacteria, fundi, yeast, protozoa, viruses.

Control. The peptides thangolds, e.g. infections, inflammation, microblally induced tumours or degenerative disorders, diarrhoea, colic, abnormalities in oral, intestinal or vaginal microflora, or caries.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          55

DNA encoding human kappa-casein – used for the prodn. of large amts. of highly purified kappa-casein milk protein for infant use.
                                                                                                                               A commercial cDNA library prepd. In lambda gtll from mRNA obtd. from human breast tissue removed during the third trimester of pregnancy was screened with rabbit anti-bovine kappa-casein cDNA. The CDNA insert of a recombinant phage was amplified by PCR to obtain a full-length clone (AAQ89598) encoding human kappa-casein (AAR72696).
                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

Kappa-casein has anti-rotaviral activity, it inhibits the attachment of human rotavirus to mammalian cells. The Kappa-casein is useful in the treatment and prevention of onset of gastroenteritis and other diarrhoeal diseases caused by rotaviridee esp. In infants, children or immunodeficient patients. Kappa-casein appeared to have no side effects on the subjects treated

The patent discloses nucleic acid sequences encoding novel secreted molecule (MOL) polypeptides, designated MOLX polypeptides (i.e. a MOL protein where X is an integer from 1 to 8). Sequences of the invention are useful for treating or preventing a MOLX-associated disorder in humans. They are useful for treating or preventing cardiomyopathy, atherosclerosis and disorders related to cell signal processing and therosclerosis and disorders related to cell signal processing and metabolic pathway modulation. The MOLX antibodies are useful for treating or preventing diabetes and disorders related to cell signal processing and metabolic pathway modulation. MOLX sequences are useful for treating or preventing diabetes and disorders related to cell signal corressing and metabolic pathway modulation. MOLX sequences are useful for the treatment or diagnosis of other MOLX-associated disorders, e.g. carring, neurodegeneration, osteoarthritis, organ rejection, cerebral thromosomal disorders, albinism, anaemia, liver cirrhosis, psoriasis, contromosomal siscensis, hypertension, systemic lupus erythematosus, immune diseases, immunodeficiency, thymman immuno deficiency virial, bacterial and fungal infections, hepatitis, rheumatoid arthritis, asthma, conternal and fungal infections, hepatitis, rheumatoid arthritis, asthma, culcers, Alzheimer's disease, parkinson's disease, thrombocytopaenia, conternal and fungal infections, barkinson's disease, humanal and conternal and fungal infections, alsease, minorals, alsease, and and alsease, and alsease,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ocular disease, muscular diseases, growth disorders, loss of libido, stress, depression, pain and epilepsy. They are useful for preventing chemotherapy side effects and as contraceptives. Sequences of the invention are also useful for gene therapy. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ä
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
vulnerary; osteopathic; haemostatic; tranquiliser; antidepressant; analgesic; vasotropic; hypotensive; gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Nucleic acids encoding secreted polypeptides, designated MOLX polypeptides, useful for treating a MOLX-associated disorder, e.g. cardiomyopathy, atheroscierosis, diabetes and metabolic disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Liu X, Shenoy S, Spytek K, Zerhusen

The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample derived from human foctal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a peptide encoded by a single exon nucleic acid probe of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from NIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                    Human; foetal liver; gene expression; single exon nucleic acid probe
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human fetal liver .
                                                                                                                                                                                                                                                                                    Peptide #4643 encoded by human foetal liver single exon probe.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Claim 27; SEQ ID NO 29772; 639pp + sequence listing; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                7
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     agents on cells. The microarray of this invention presents a far greater diversity of probes for measuring gene expression, with far less bias than expressed sequence tag microarrays. The method is suitable for rapid production of functional information from genomic sequence. The present sequence is a peptide encoded by a single exon nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a spatially-addressable set of single exon nucleic acid probes for measuring gene expression in a sample derived from human breast and BT 474 cells. The method involves contacting the probes with a collection of detectably labelled nucleic acids derived from mRNA of human breast, and then measuring the label bound to each probe of the microarray. The probes are useful for verifying the expression of regions of genomic DNA predicted to encode proteins. They are useful for gene discovery, and for determining predisposition and/or prognosing breast disease. Gene expression analysis is useful for assessing the toxicity of chemical
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                       Peptide #4550 encoded by breast cell single exon nucleic acid probe.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             for measuring gene expression in sample derived from human, comprises number of single exon nucleic acid probes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New spatially-addressable set of single exon nucleic acid probes,

probe

```
probes which are derived from genomic sequences expressed in the human brain. They can be used to measure gene expression in brain cell samples, which may enable the diagnosis and improved treatment of nervous system diseases such as Alzheimmer's disease, multiple sclerosis, schizophrenia, the probes of the invention.
                                                                                                                                                                                                                                                                                                                     Single exon nucleic acid probes for analyzing gene expression in human brains
                                                                                                                                                                                                                                                                                                                                                                                                       The present invention provides a number of single exon nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human bone marrow expressed probe encoded protein SEQ ID NO: 30581.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; bone marrow expressed exon; gene expression analysis; probe; microarray; cancer; leukaemia; lymphoma; myeloma.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to single exon nucleic acid probes for measuring human gene expression in a sample derived from human heart (see MARA1535-ABA41305). The present sequence is a protein encoded by one such probe. The probes may be used for predicting, measuring and displaying gene expression in samples derived from the human heart via microarrays. By measuring gene expression, the probes are useful for predicting, human heart and vascular system e.g. cardiovascular diseases of the human heart and vascular system e.g. cardiovascular disease. hypertension, cardiac arrhythmias and congenital heart disease. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ;;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human brain expressed single exon probe encoded protein SEQ ID NO: 29962.
                                                                                                                                                                                                                                                                                                                                                                                                                                            Single exon nucleic acid probes for analyzing gene expression in human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    n expressed exon; gene expression analysis; probe; Alzheimer's disease; multiple sclerosis; schizophrenia;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to human single exon nucleic acid probes (SENE: see AA110069-AA120459). The present sequence is a peptide encoded by one such probe. The SENPs are derived from human HeLa cells. The SENPs can be used to produce a single exon microarray, which can be used for measuring human gene expression in a sample derived from human cervical
                                                                                                                 The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human bone marrow. They can be used to measure gene expression in bone marrow samples, which may enable the improved diagnosis and treatment of cancers such as lymphoma, leukaemia and myeloma. The present sequence is a protein encoded by one of the probes of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                  Peptide #4536 encoded by probe for measuring cervical gene expression

The present sequence is a peptide encoded by one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of
                                                                                                                                      Peptide #4651 encoded by probe for measuring placental gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

```
The present invention relates to novel single exon nucleic acid probes (see AAI00010-AAI10067). The present sequence is a peptide encoded by one such probe. The probes are useful for measuring human gene expression in nucleic acid expressed in the human breast. The probes at high stringency to a predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human breast, particularly those diseases with polygenic actiology. The diseases include: breast cancer, disorders of development, inflammatory diseases of the breast, fibrocystic changes, proliferative
                                                                                                                                                                                                      Probe; human; breast disease; breast cancer; development disorder; inflammatory disease; proliferative breast disease; non-carcinoma tumour.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      breast disease and non-carcinoma tumours.

Once: The sequence date for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

measure gene expression in human lung samples Claim 27; SEQ ID No 29583; 634pp; English.

```
The invention relates to a spatially-addressable set of single exon nucleic acid probes for measuring gene expression in a sample derived from human lung comprising single exon nucleic acid probes having one of 15014 uncleic acid sequences mentioned in the specification, or their complements or the 12387 open reading frames derived from the 12614 probes. Also included are a microarray comprising the novel set of probes; the novel set of probes which hybridise at high stringency to a nucleic acid expressed in the human lung; measuring gene expression in a sample derived from human lung, comprising (a) contacting the array with a collection of detectably labeled nucleic acids derived from human lung mRNA, and (b) measuring the label detectably bound to each probe of the array; identifying exons in a eukaryotic genome, comprising (a) algorithmically predicting at least one exon from genomic sequences of the eukaryote; and (b) detecting specific hybridisation of detectably labeled nucleic acids from eukaryote lung mRNA, to a single exon probe, having a fragment identical to the predicted exon, the probe is included in the above mentioned microarray; assigning exons to a single gene, comprising (a) identifying exons from genomic sequence by the method above and (b) measuring the expression of each of the exons in several transcers and/or cell types using hybridisation to a single exon microarrays having a probe with the exon, where a common pattern of expression of the exons in the issues and/or cell types using hybridisation cell types indicates that the expression of each of the exons in the issues and/or cell types using hybridisation cell types indicates that expression of the exons in the issues and/or cell types indicates that expression of the exons in the issues and/or cell types indicates that expression of each expression of the exons in the issues and/or cell types indicates that expression of each expression of each expression of each expression of the exons in reverse and expression of each expression e
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Such as asthma, lung cancer, chronic obstructive pulmonary disease (COPD), interstitial lung disease (ILD), familial idiopathic pulmonary fibrosis, neurofibromatosis, tuberous sclerosis, Gaucher's disease, Niemann-Pick disease, Hermansky-Pudlak syndrome, sarcoidosis, pulmonary
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            the exons should be assigned to a single gene; a peptide comprising one of 1201 sequences, mentioned in the specification, or encoded by the probes/open reading frames (ORF). The probes are used for gene expression analysis, and for identifying exons in a gene, particularly using human lung derived mRNA and for the study of lung diseases

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PER) primers oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations
                                                                                                                                                                                                                                                               ñ
haemosiderosis, pulmonary histicoytosis, lymphangioleiomyomtosis, pulmonary alveolar proteinosis, Karagener syndrome, fibrocystic pulmonary dysplasia, primary cillary dyskinesis, pulmonary hypertension and hyaline membrane disease. The present sequence is a peptide/protein encoded by a single exon probe of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at fibe.
                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess biodiversity
                                                                                                                                                                                                                                                               5

CC responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and cannot be produce other types of data and products dependent on DNA and cannot acid sequences. ABG00010-ABG30377 represent novel human of diagnostic amino acid sequences of the invention.

CC diagnostic amino acid sequences of the invention.

Note: The sequence of this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO CC at ftp.wipo.int/pub/published_pct_sequences.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

SUBUNIT: HETEROMULTIMERS COMPOSED OF ALPHA-SI CASEIN AND KAPPA
CASEIN LINKED BY DISULFIDE BONDS.
SUBCELLULAR LOCATION: Extracellular.
TISSUE SPECIFICITY: MANMARY GIAND; MILK.
PTM: The N-terminus is blocked.
SIMILARITY: Balongs to the kappa-casein family.
DATABASE: NAME-Protein Spotlight;
NOTE-ISSUE 16 of November 2001;

"Sequence analysis of Camelus dromedarius milk caseins.";

"Sequence analysis of Camelus dromedarius milk caseins.";

J. Dalry Res. 65:209-222(1998).

-! FUNCTION: Kappa casein stabilizes micelle formation, preventing casein precipitation in milk.

-! SUBCELLULAR LOCATION: Extracellular.

-! TISSUE SPECIFICITY: MAMMARY GLAND; MILK.

-! SIMILARITY: Belongs to the kappa-casein family.

FUNCTION: Kappa casein stabilizes micelle formation, preventing casein precipitation in milk.

FUNCTION: Extracellular.

FUNCTION: MAMMARY GLAND; MILK.

FUNCTION: Belongs to the Kappa-casein family.

SIMILARITY: Belongs to the Kappa-casein family.
                                                                                                                                                                                                                            This SWISS-PROT entry is copyright.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         O-LINKED (GALNAC. .) (BY SIMILARITY). PHOSPHORYLATION (BY SIMILARITY).
-1-.FUNCTION: Kappa casein stabilizes micelle formation, preventing casein precipitation in milk.
--- SUBCELLULAR LOCATION: Extracellular.
--- TISSUE SPECIFICITY: MANMARY GLAND; MILK.
--- SIMILARITY: Belongs to the kappa-casein family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  SEQUENCE FROM N.A.
